Data

Download and read the testing and training sets.

```
urlTrain <- "http://d396qusza40orc.cloudfront.net/predmachlearn/pml-training.csv"
urlTest  <- "http://d396qusza40orc.cloudfront.net/predmachlearn/pml-testing.csv"
```

Load the data and corresponding packages to complete the project

```

Cleaning and Exploring the Data

We need to remove the features that are not in the testing set. We do so by deleting the first seven features as they are non-numeric and related to the time sereies columns NA's. The testing set is not time dependent thus the NA inputs (var, mean, and SD) are irrelevant.

Data Partitioning

We will divide our data into a training set and a testing set based upon the lessons from Course 8. a 60:40 ratio should be able to estimate out the sample error of the predictor.

```
#Partition the data
set.seed(129)

p_Train <- createDataPartition (Train$classe, p =0.6, list = FALSE)

trainset <- Train [p_Train, ]
testset <- Train [-p_Train, ]

Modeling

We will use several different models to predict the outcomes.

Decision Tree (DT)

```
DTmodel <- rpart(classe ~., data = trainset, method = "class")
rattle::fancyRpartPlot (DTmodel)
```

```
## Warning: labs do not fit even at cex 0.15, there may be some overplotting

outcome <- predict(DTmodel, testset, type = "class")
confusionMatrix (outcome, testset$classe)

Conclusion

The Random Forest model is extremely accurate, >99%. The Decision Tree model has a relatively high error rate (~20%). Therefore we should utilize the RF model as test cases validated its accuracy.
